

Making documents that are easy to understand is hard, especially Easy Read documents for people with intellectual disabilities or reading difficulties. So, we tried to use a computer program called Chat GPT to help us make these Easy Read documents.

We did many tests using reports from the project. At first it didn't work very well, but we kept trying different ways until we found the best one.

At the end, we asked Chat GPT to change a piece of the report to Plain English, and then to Easy Read. This was the best way we found to make documents easy to understand.

We think there is great potential in using computers to help us make other things easier to understand, like street plans and technical documents.

This could help save time and make it easier for everyone to understand. We will keep learning to use AI to make our work better.
